Reportable Motor Vehicle Collisions

The Transportation & Streets Department, Evaluation & Monitoring Services, maintains an annual computerized file containing details of reportable motor vehicle collisions in the City of Edmonton. In addition to the annual reports presented in this publication, accident detail by location is available upon request (see front page for contact person).

This year's section on annual Accident Rates includes accident statistics for all intersection locations with 14 or more accidents, and all mid block locations with 8 or more accidents. The annual Accident Cause section includes cause breakdown for all intersection and river bridge locations with 14 or more accidents, and the worst 50 intersection and river bridge locations for each of the seven common causes (see definitions on page 3).

Year to Year Changes - Interpretation of the Results

Total motor vehicle collisions in 2001 increased to 21,000, a total of 8 collisions more than in 2000. This minimal increase in vehicle collisions is accompanied by major increases in total injuries, 4.9%, in total fatalities, 26.3%. Fatalities increased by 5 to 24 deaths, rising for the second time since setting a record low of 16 deaths in 1997. Contributing to the majority of fatalities were 7 vehicle driver deaths, up by 1 from 2000 and 11 pedestrian deaths, up by 2 from 2000.

All aspects of pedestrian accidents have increased significantly, 23.2% more collisions, 22.6% more injuries, and 2 more pedestrian deaths a rise from 9 to 11. After reaching a low of 3 deaths in 1999 for the second time in 5 years, pedestrian deaths are again on the rise and contribute to near half of all fatalities in the year 2001. Our accident database reports the pedestrian accident cause as either pedestrian error or vehicle error. Eight of the 11 pedestrian deaths were a result of the vehicle error. Of these, 6 occurred in the intersection controlled by either a signal, stop sign or a marked crosswalk, 1 occurred in a mid-block segment with no traffic controls present, and 1 in a service road with no control present.

All aspects of motorcycle collisions have increased significantly, 41% more collisions and 39.8% more injuries. Fatalities increased by 1 to 2 deaths, an increase for the second year, after setting a record of no motorcycle deaths in 1999. This year motorcycle collisions occurred during the typical motorcycling season of seven months, March to October.

Most aspects of bicycle accidents have increased, 6.1% less collisions and 7.0% less injuries. However, cyclist deaths decreased by one to none, for the third time in the last 10 years. Contributing to the increase is the continuing rise in popularity of cycling and improvements in bicycle technology allowing cyclists to travel over less varying road conditions. The majority of bicycle collision occurred during a 10 month period, two months longer than the average 8 month season. This may be a reflection of an exceptionally mild winter and good road conditions during winter months. Accident causes reflect movements made by vehicles on the roadway. Bicycle accidents have a high uninformative action of "other" due to a number of collisions where the cyclist enters the roadway from a sidewalk, or is struck by a vehicle running off the road.

City of Edmonton did not carry out a census in 1988, and from 1994 - 2000.

Population for 1994, 1995, 1996, 1997 is based on the "Socio - Economic Forecast 1995 - 2000, City of Edmonton" report, prepared by the City Forecast Committee and updated April 1997. Population for 1998 and 1999 is based on the "Socio - Economic Forcast 1998 - 2003, City of Edmonton" report, updated April 1999. Population for 2000 is based on the "Socio - Economic Forcast 2001 - 2006, City of Edmonton" report, updated April 2001. Population for 2001 is from the census conducted by the Federal Government.

* From 1983 to 1991 the only change in reportable accident parameters was " property damage ". On January 1, 1991 the minimum property damage increased from $500 to $1000.

Definitions

Accidents - as used in this report refer to reportable on-street accidents, (i.e. which result in $1000 property damage and/or injury, and do not occur on private property). The statistics include all 2001 reportable accidents which were forwarded to the Transportation Department by the City of Edmonton Police Department before March 7, 2002.

- our file does not include non-vehicular collisions such as cyclist hitting pedestrians, each other, fixed objects, or injuries sustained by passengers who hit the windshield or the floor when the driver brakes suddenly to avoid a collision.

Injury - includes injuries ranging in severity from minimal (scrapes, bruises complaint of pain) to major (treated and detained in hospital).

Autos - cars, trucks, and vans under 4500 kg

Trucks - tractor trailers, trucks, and vans 4500 kg. and over.

Intersection - include accidents which occur inside and 10 meters past the legally defined limits of the outer crosswalk lines of an intersecting roadway.

Midblock - include accidents which occur on a section of roadway between two intersections. They include the balance of accidents which do not occur in intersections as defined above, in lane ways, nor in service roads.

River Bridge - refers to the 8 bridges that span the North Saskatchewan River: the Clover Bar, the Dawson, the James MacDonald, the Low Level, the 105 Street, the High Level, the Groat, and the Quesnell.

Seven Common Causes - refers to the most frequently reported conflicts:

A- Followed too closely
B- Failed to observe traffic signal
C- Left turn across path
D- Stop, yield, no control violation
E- Changing lanes improperly
F - Improper turn
G- Failed to yield to pedestrian
H- Pedestrian error/violation
I - Signed forced turn violation
J - Other and unknown

Appendix B

High Accident Locations

HIGH ACCIDENT LOCATIONS

The file of high accident locations which contains number of accidents and accident severity information has been supplemented with information on roadway characteristics and usage. Accident totals and usage are then used to calculate accident rates. All these descriptors are then ranked from high to low with in each category and presented in absolute values and ranking. In order to limit manpower requirements, only intersections with 14 or more accidents and mid block roadway portions with 8 or more accidents are included.

Separate listings are provided for intersection and mid block locations. Each is presently sorted by three different parameters: number of accidents, accident rate, and location. The total accident and accident rate files are listed from the highest to the lowest value. The location sort is listed from low to high numeric avenue, with low to high street listed with in each avenue. For each feature at a location, the absolute values are in (brackets), and are preceded by a ranking. A secondary sort, by accident rate, occurs with in each unique descriptor.

The header at the top of each page is consistent in all six reports. Details of each portion of the header are:

LOCATION DESCRIPTION: includes avenue and street descriptors in intersections and mid block listings. The "QD" refers to quadrant: NW, NE, SE and SW.

NUMBER OF ACCIDENTS: self explanatory

ACCIDENT RATE: is defined as the number of accidents divided by the exposure of vehicles to accidents. It is expressed as accidents per million vehicles entering the intersections, and as accidents per million vehicle kilometer for mid block.

NUMBER OF INJ./FATAL: refers to the total number of injuries and/or fatalities at the location indicated.

PROPERTY DAMAGE: in 1000's of dollars.

TOTAL VOLUME: refers to total inbound volumes for intersections.

DISTANCE: kilometers reference the entire length of roadway from the intersection listed to the next avenue to the north or the next street to the west. (used for mid-block listings only)
